Oil Burner Controls

Oil burner controls for the supervision, startup and control of single- or 2-stage forced draft oil burners in intermittent operation. Oil throughput up to 30 kg/h.

The LOA2... / LOA3... and this Data Sheet are intended for use by OEMs which integrate the oil burner controls in their products.

Use, features

Use

The LOA... are used for the startup, supervision and control of single- or 2-stage forced draft oil burners in intermittent operation. Yellow-burning flames are supervised with photoresistive detectors QRB..., blue-burning flames with blue-flame detectors QRC...

- Forced draft oil burners conforming to EN 267
- Oil atomization burners as monoblocks conforming to EN 230

General features

- Undervoltage detection
- Bridging contact for oil preheater (not with LOA28.173A27)

Specific features

- Special versions including models for incinerator plant and flash-steam generators
- LOA36... with color LED for indicating flame strength and operation
Warning notes

To avoid injury to persons, damage to property or the environment, the following warning notes should be observed!

Do not open, interfere with or modify the unit!

- Before performing any wiring changes in the connection area of the LOA..., completely isolate the unit from the mains supply (all-polar disconnection)
- Ensure protection against electric shock hazard by providing adequate protection for the burner control’s connection terminals
- Check to ensure that wiring is in an orderly state and that the wires are firmly connected
- Press the lockout reset button / operating button only manually (applying a force of no more than 60 N), without using any tools or pointed objects
- Fall or shock can adversely affect the safety functions. Such units may not be put into operation, even if they do not exhibit any damage

Mounting notes

- Ensure that the relevant national safety regulations are complied with

Installation notes

- Installation and commissioning work must be carried out by qualified staff
- Do not mix up live and neutral conductors
- Always run high-voltage ignition cables separately while observing the greatest possible distance to the unit and to other cables

Electrical connection of flame detectors

It is important to achieve practically disturbance- and loss-free signal transmission:

- Never run the detector cable together with other cables
  - Line capacitance reduces the magnitude of the flame signal
  - Use a separate cable
- Observe the permissible lengths of the flame detector cables (refer to Data Sheets 7714 (QRB...) and 7716 (QRC...))

Commissioning notes

- Commissioning work must be carried out by qualified staff
- When commissioning the plant, when carrying out maintenance work, or after longer off periods, make the following safety checks:

<table>
<thead>
<tr>
<th>Safety check</th>
<th>Anticipated response</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Burner startup with flame detector darkened</td>
<td>Lockout at the end of «TSA»</td>
</tr>
<tr>
<td>b) Burner startup with flame detector exposed to extraneous light</td>
<td>Lockout after approx. 40 seconds</td>
</tr>
<tr>
<td>c) Simulation of flame failure during operation. For that purpose, darken the flame detector during operation and maintain this state</td>
<td>Repetition followed by lockout at the end of «TSA»</td>
</tr>
</tbody>
</table>
Standards

Conformity to EEC directives
Electromagnetic compatibility EMC (immunity) 89 / 336 EEC
Low-voltage directive 73 / 23 EEC

Service notes

- Maintenance work must be carried out by qualified staff
- Each time a unit has been replaced, check wiring to ensure it is in an orderly state and that the wires are firmly connected; make the safety checks as indicated in «Commissioning notes» above
- Use the KF... test adapters for short periods of time only

Disposal notes

The unit contains electrical and electronic components and may not be disposed of together with household waste.
Local and currently valid legislation must be observed.

Mechanical design

The housing is made of impact-proof, heat-resistant and flame-retarding plastic.
The oil burner control is of plug-in design and engages audibly in its base.

The housing accommodates the
- thermal-electric sequence switch
- flame signal amplifier with the flame relay
- lockout reset button with its integrated fault indication lamp

Type summary

The type references given below apply to burner controls without base and without flame detector.

Legend

¹) LOA25... and LOA28... are designed for use on incinerator plant where lockout by extraneous light is not desired. These types of oil burner controls are not covered by EN 230
²) IRD1010 infrared flicker detectors can also be used

t1 Prepurge time
t3 Preignition time
t3n Long postignition time
t3n’ Short postignition time
t4 Interval from establishment of flame to the release of «BV2»
TSA Ignition safety time
### Ordering

**Oil burner control** without plug-in base refer to «Type summary»

**Electrical connections** refer to Data Sheet 7201
- Plug-in base AGK11...
- Cable holders AGK65..., AGK66, AGK67...
- Cable strain relief elements for AGK67...

**Electrical connections** refer to Data Sheet 7203
- Plug-in base AGK13
- Plug-in housing AGK56
- Cover AGK68

**Flame detectors** refer to Data Sheet 7714
- Photoresistive detectors QRB1...
- Blue-flame detectors QRC1...

**Pedestal** (empty housing) AGK21
- To increase the overall height of the LOA...to that of the LAI... / LAB...

**Remote reset module** ARK21A27
- For use with the LOA26... / LOA36... printed circuit board versions

**Adapter** KF8819
- For replacing LAB1... / LAI... by LOA...
- No rewiring of plug-in base required

**Demo case** KF8891
- For showing the functioning of burner controls
- Refer to Operating Instructions B7989

**Test case**, for making functional tests KF8843
- For testing burner controls
- Refer to Operating Instructions B7986

**Test adapter** KF8885
- For testing burner controls
- With switch for manual startup of burner
- With switch for simulating the oil preheater’s release contact
- With 2 pairs of jacks for measuring the flame detector current
- Refer to Mounting Instructions C7981

**Test adapter** KF8833
- For testing burner controls fitted to the burner
- With signal lamps for program indication
- With 2 jacks for measuring the flame detector current

**Test adapter** KF8840
- For testing burner controls fitted to the burner
- With signal lamps for program indication
- With switch for simulating the flame signal
- With holes for checking the control voltages at the tabs of the burner control
- With 2 jacks for measuring the flame detector’s resistance

¹) These types of LOA... may not be used in connection with QRC...blue-flame detectors

Data given in the above table only apply under the following conditions:
- Mains voltage AC 230 V
- Ambient temperature 23 °C

**Legend**

- µA DC: DC microammeter with an internal resistance of Ri = max. 5 kΩ
- bl: Blue
- sw: Black
- br: Brown

**Measuring circuit for detector current**

Only with LOA36...

**Indication of flame strength**
- With QRB... min. 60 µA ±15 %
- With QRC... min. 40 µA ±15 %
Function

Preconditions for startup

- Burner control is reset
- Contacts in the line are closed
- No undervoltage
- Flame detector is darkened, no extraneous light

Undervoltage detection

An additional electronic circuit ensures that if mains voltage drops below approximately AC 165 V, burner startup will be prevented, or – without release of oil – lockout will be triggered.

Control sequence in the event of fault

Whenever lockout occurs, the outputs for the fuel valves, the burner motor, oil preheater and ignition equipment will immediately be deactivated (< 1 second).

The lockout indication lamp changes to red and terminal 10 («AL») for remote lockout indication receives voltage.

This state is also maintained in the event of mains voltage failure.

<table>
<thead>
<tr>
<th>Cause</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mains voltage failure</td>
<td>New start</td>

</tr>
<tr>
<td>No flame at the end of «TSA»</td>
<td>Lockout</td>
</tr>
<tr>
<td>Loss of flame during operation</td>
<td>Repetition</td>
</tr>
</tbody>
</table>

Reset

After lockout, the burner control can be reset after 60...90 seconds (also refer to «Warning notes»).

Indications

Lockout position

The lockout position is indicated with the lamp integrated in the lockout reset button.

Flame strength

Only with LOA36...

Indication of the flame strength (green LED) is used for checking the flame signal. To ensure reliable burner operation, this LED must be lit. If the green LED flickers or extinguishes during burner operation, the light conditions at the burner are poor, caused by dirt for instance.

Operation

Only with LOA36...

When the contacts of the control thermostat are closed, the orange LED is lit, indicating the start of the oil preheater’s heating up phase (if present).

Remote lockout reset module ARK21A27

Remote lockout reset module for use with the LOA26... / LOA36...

Printed circuit board with no housing.

Degree of protection IP 00, which means that protection against electric shock hazard must be ensured through mounting.

Do not place any metal objects in the hatched area.

The module must be fitted with the help of spacers made of plastic.

Do not use spacers made of metal.
